Contents

1 Supported FEM file formats

Not all functionality defined for the exchange file formats is supported. The supported subset is currently mainly defined by the functionality supported in GLFrame rspt. the BMF file format.

More detailed information on supported functionality can be found in the according directories in the doc dubdirectory.

1.1 NASTRAN Bulk Data Format (BDF)

1.1.1 BDF Cards supported

1.1.1.1 Bulk Data

	GRAV	Acceleration or Gravity Load	✓	✓
Misc				
	ENDDATA	Marker for end of input file	✓	✓

1.1.1.2 Header Data

Name	Description	Read	Write
SOL	Execute a Solution Sequence	☹	✓
CEND	End of Executive Control Delimiter	☹	✓
TITLE	Output Title	☹	✓
ECHO	Bulk Data Echo Request	☹	✓
DISPLACEMENT	Displacement Output Request	☹	✓
SPCFORCES	Single-Point Forces of Constraint Output Request	☹	✓
STRESS	Element Stress Output Request	☹	✓
LOAD	External Static Load Set Selection	☹	✓
SUBTITLE	Output Subtitle	☹	✓
SUBCASE	Subcase Delimiter	☹	✓
BEGIN BULK	Case Control and Bulk Data Delimiter	☹	✓

[1] Twisting CBEAM cross section by using the BIT flag is not supported. Offset via OFFT is only supported for the same offset at *A* and *B* end of beam.

1.2 DNV GL Seasam Input Interface File (FEM)

1.2.1 FEM Cards supported

1.2.2 Element Types in SESAM

Conventions for use of the interface file for the elements in SESAM are defined here. Other element types may be introduced for use in other programs.

The table below contains element type numbers already reserved. (Not all of them are included in SESAM).

For ADVANCE, the element types listed are those available from the SESAM preprocessors. In addition to that ADVANCE has a lot of other element types.

Table 1: List of existing Element Types

[11] Temporarily ADVANCE interprets Axisl Spring as link element, ignoring the material reference. The 6 matrix numbers are given in direct input to ADVANCE.
[12] The element subroutines are the same as for the subparametric curved thick shells (SCQS and SCTS).
[13] As General Spring it is just a 2-noded spring (12x12 matrix) which may be in a local coordinate system. As a shim element the preprocessor(s) will only insert stiffness in the local x- and y-direction. In the analysis program(s), shim members and general springs are treated exactly in the same manner.
